Healthcare Operational Reasoning Benchmark Suite (HORB) v1.0

One-page portfolio summary for healthcare AI evaluation, clinical QA, and model response review roles

Project Overview

HORB v1.0 is an original healthcare AI evaluation portfolio project designed to assess whether large language models can reason through realistic clinical operations rather than simply retrieve facts or summarize documents. The suite evaluates whether a model can distinguish apparent operational readiness from actual executable readiness when information is incomplete, conflicting, time-sensitive, or distributed across multiple fictional workflow documents.

Core evaluation question: Can an AI produce operationally realistic recommendations while respecting workflow constraints, source evidence, ownership boundaries, and unresolved uncertainty?

What I Built

- 12 original multi-document benchmark scenarios across healthcare operations
- Fictional source documents, user prompts, system instructions, and grading guidelines
- Consistent benchmark design briefs for HORB-001 through HORB-012
- Failure-mode taxonomy focused on operational reasoning errors
- Portfolio package and full PDF overview for application/work-sample use

Capabilities Demonstrated

- Clinical workflow reasoning
- Rubric-based AI evaluation
- Source-grounded response review
- Prompt and system-instruction design
- Healthcare documentation analysis
- Operational prioritization
- Uncertainty and failure-mode analysis

Benchmark Domains

HORB-001 - Labor & Delivery / OB Triage	HORB-002 - Sterile Processing / Case-Cart Readiness
HORB-003 - Home Health Visit Coordination	HORB-004 - Outpatient Infusion / Oncology Readiness
HORB-005 - Hospice On-Call / Symptom Crisis	HORB-006 - Emergency Department Flow
HORB-007 - Perioperative Add-On / Turnover	HORB-008 - Behavioral Health Intake / Safety Placement
HORB-009 - Medication Reconciliation / Discharge Readiness	HORB-010 - Case Management / Discharge Throughput
HORB-011 - Pre-Admission Testing / Day-of-Surgery Clearance	HORB-012 - Primary Care Same-Day Triage

Relevance to Target Roles

Strong fit for: healthcare AI evaluation, clinical QA, medical data annotation, model response grading, clinical documentation review, medical content review, and remote clinical review roles.	Signature insight: Healthcare operations reward appropriate restraint as much as decisive action. Strong evaluation requires recognizing when a workflow is not yet executable.
